In this book we study Hilbert schemes of zero-dimensional subschemes of smooth varieties and several related parameter varieties of interest in enumerative geometry. Hilbert scheme - Wikipedia

For example, one might expect the Hilbert scheme of d points (more precisely dimension 0, length d subschemes) of a scheme of dimension n to have dimension dn , but if $n \geq 3$ its irreducible components can have much larger dimension. Examples. The hilbert scheme of points of a closed point is just a point.

Non-commutative Hilbert schemes, introduced by M. V. Nori, parametrize left ideals of finite codimension in free algebras. More generally, parameter spaces of finite codimensional submodules of free modules over free algebras are considered. Cell decompositions of these varieties are constructed, whose cells are parametrized by certain types of forests. Properties of the corresponding generating functions of Poincaré polynomials are discussed.
