 Even at this writing, in 1978, the word "kinetics" is considered by many chemists to be synonymous with "kinetics of neutral species". Yet in spite of the relatively late start and separation from the mainstream of kinetics, the field of ion physics and chemistry is flourishing, and growing at an ever faster pace.

 This retrospective paper briefly summarizes the very early work (pre 1930) on the kinetics of ion-molecule reactions but the main emphasis is on the extensive work in the 1950s and 1960s using single-source mass spectrometers which established the field of gas-phase ion-molecule reactions as an important field of study.

 A different aspect of ion-molecule reactions is investigated by the addition of a drift field to the flow tube which allows the evaluation of the rate coefficient as a function of the center-of-mass kinetic energy. The reaction of N⁺ + CS has shown the rate coefficient to be relatively

consistent over the energy range studied.

G3(MP2) calculations of the ion energetics properties of DMMP, sarin, and soman were also performed. The calculated ionization potentials, proton affinities, and fluoride affinities were consistent with the trends in the measured kinetics and product ion branching ratios.

Kinetics of Gas-phase Ion Molecule Exchange Reactions ...

The kinetics of ion molecule exchange reactions (IMR), which are important in high-energy and analytical chemistry, are discussed, and their special features and the factors influencing the reaction rate are analysed. Special attention is paid to slow IMR with rate constants substantially smaller than the gas-kinetic ion molecule collision rate.
