This chapter discusses probability measures in a metric group. For any two measures and , the convolution  $\ast v$  is defined as the set function  $\ast (\cdot) = (\cdot - 1) d(x)$ , where  $A \subset B \subset X$ . The chapter also discusses the properties of the class of all indecomposable measures. A measure is said to be decomposable if there exist two nondegenerate measures and such that  $\ast = \ast$ .

can put a measure. A measure is a nonnegative countably additive set function; that is, a function  $\nu : F \rightarrow R$  with (i)  $\nu(A) \geq 0$  for all  $A \in F$ , and (ii) if  $A_i \in F$  is a countable sequence of

disjoint sets, then  $\mu(A \cup B) = \mu(A) + \mu(B)$ . If  $\mu(X) = 1$ , we call a probability measure. In this book, probability measures are usually denoted by  $P$ .
