 In a connected unipotent group there is a sequence of normal subgroups such that all quotients are one-dimensional. Every connected one-dimensional unipotent algebraic group is isomorphic to  $\mathbb{G}_a$ . This reduces the study of connected unipotent algebraic groups to a description of iterated extensions of groups of type  $\mathbb{G}_a$ .

Unipotent algebraic groups. An element,  $x$ , of an affine algebraic group is unipotent when its associated right translation operator,  $r_x$ , on the affine coordinate ring  $A[G]$  of  $G$  is locally unipotent as an element of the ring of linear endomorphism of  $A[G]$ .

A unipotent group  $SUS$  over a field  $KS$  of characteristic zero is always connected; moreover, the exponential mapping  $\mathbb{S} \exp : \mathfrak{u} \rightarrow US$ , where  $\mathfrak{u}$  is the Lie algebra of  $SUS$  is an isomorphism of algebraic varieties. This is no longer true in prime characteristic.

Any algebraic group contains a unique normal linear algebraic subgroup  $H$  such that their quotient  $G/H$  is an abelian variety. Linear algebraic group. An algebraic  $k$ -group is linear if it is a Zariski-closed subgroup of the general linear group  $GL(n, k)$  for some  $n$ . An algebraic group is linear iff it is affine.
